[PLACEHOLDER]

Data source: PS-0 PropertyScraper autonomously collects listings from PropertyPro.ng, PrivateProperty.com.ng, and NigeriaPropertyCentre.com on a weekly discovery cadence with mid-week health checks.

Neighbourhood normalisation: Raw neighbourhood strings from all portals are normalised to a canonical name via a manually-curated mapping table. Only neighbourhoods with $\geq 90\%$ normalisation coverage are included in analysis.

Price storage: All prices are stored internally as 64-bit integer kobo values to eliminate floating-point arithmetic errors. NGN figures displayed in this report are exact integer divisions by 100.

Median vs. mean pricing: Median is used throughout to reduce skew from outlier luxury listings. P25, P75, and P90 data are available in the source dataset but excluded from this summary report for brevity.

Price reductions: An event is recorded when a listing's price decreases between two consecutive observations. Multiple reductions on the same listing count as separate events.

Days on market (DOM): Computed as the number of days between a listing's first observed date and the snapshot date. Listings present since before the pipeline's inception show DOM from the first observation date, not the actual listing date.

Outage handling: On weeks where portal access was blocked or failed, active inventory is carried forward from the prior week. New listing counts are recorded as zero for that week. These weeks are noted in the weekly table.
